## CLOSSARY

BURLS
Burls are responsible for the formation of a number of interesting natural designs. A burl is an abnormal, wartlike excrescence on the trunk, stump or branches of a tree. Because of this, many bizarre figures are derived from veneers cut from burls. Burl veneer has high decorative value for inlays and overlays and for matching into four, eight or more combinations. The Italians are the masters of cutting and matching burls.

## COLORFIN FORM

A very strong multi-ply birch panel that is impregnated with phenolic resin, which gives it a smooth surface. Originally used for concrete work. Now being specified by architects and designers for furniture, built-ins and custom commercial applications.

## COUNTERFRONT

The grain direction of the hardwood face veneer running in the short direction of the panel. Used in wainscoting.

## CROTCH

Type of veneer figuring originating from the intersection of the limb or branch with the main trunk of the tree. Producing exceptional figure referred to as "feather."

## EUROPEAN POPLAR LUMBERCORE

A short grain reveneering platform produced of solid poplar strips edge glued and face glued to a poplar veneer cross banding. Light in weight and stays straight. Excellent for doors.

## GRADING

No two trees are exactly the same. For this reason the industry, through its association HPVA (Hardwood Plywood and Veneer Association), has developed a system of grades to describe the appearance and performance characteristics of hardwood plywood. Grading is a position in a scale of qualities. The price of a hardwood plywood panel is based, to a considerable degree, upon the quality and species of the face. The higher the quality and more costly the face veneer, the higher the price.

## GRAIN

The direction, size, arrangement and appearance of the fibers in wood and/or veneer.

## MARINE GRADE

Plywood panels manufactured with the same glueline durability requirements as other exterior type panels but with more restrictive veneer quality requirements. The grade is particularly suitable for marine applications where bending is required, as in boat hulls. The face and the innerpiles have to be of the same species for the expansion and contraction rates will be equal, allowing for a uniform bond.

## MDF

Medium Density Fiberboard (fiber). A panel or core product manufactured from wood fibers combined with a synthetic resin or other bonding system. MDF is manufactured by the application of heat and pressure by a process in which the fiber bond is substantially created by the added adhesive system.

## MELAMINE

A resin impregnated decorative paper thermally fused to a substrate, usually particleboard.
Panolam brand melamine is highly resistant to stains, scratches, abrasions, chip out, steam and radiant heat. Panolam offers a wide variety of colors, patterns and wood grains at a fraction of the cost of high laminate. Panolam brand melamine is stocked in thickness from $1 / 4$ to 1"1/8.

## MULTI-PLY

A strong European birch panel consisting of select cross branded birch veneers bonded together under heat, pressure and a water proof, boil proof adhesive. Multi-ply birch gives the look of a decorative edge with layers of 1.4 mm crossbands giving a 24 mm piece seventeen plys.

## NAF

No Added Formaldehyde

A 2-ply flexible veneer using a whole piece wood backer of similar grain and color. NBL eliminates bubbling, solvent seepage and core telegraphing. In stock in a wide variety of species.

## PB VENEER

Paperback Veneer. A flexible veneer available in a wide variety of species, affixed to a craft paper by means of glue, heat and pressure. 10 mil: A .10 mm craftpaper back laminated to a hardwood face veneer under heat and pressure.
20 mil: A 20 mm craftpaper laminated to a hardwood face veneer under heat and pressure.

## PRE FINISHED PLYWOOD

A clear topcoat produced through a flat line finishing process. This process uses a precision differential roller to apply four sealer coats and an ultraviolet cured topcoat consisting of an acrylate that is $100 \%$ solids.

## SLAB

(Flitch Cut) A veneer quality log sawn through and through as lumber. Yielding greatest possible widths, color and grain consistency, and all natural beauty of the log, including bark and sap.

## SLIPMATCHED

A sheet from a flitch is slid across the sheet beneath and, without turning, spliced at the joints.

## SM\#

Sequence matched and numbered face veneer panels. A method of arranging veneer faces such that each face is in order relative to its original position in the tree and therefore, contains features of grain and figures similar to adjacent faces. Three or more such related faces are required to constitute a sequence.
Book Match: Adjacent pieces of veneer from a flitch or log are opened like a book and spliced to make up the face with matching occurring at the spliced joints. The fibers of the wood, slanting in opposite directions in the adjacent sheets, create a characteristic light and dark effect when the surface is seen from an angle.

Veneer core. A core type consisting of layers of veneer alternately cross laminated at 90 degrees.

## WPF

Whole piece face. A rotary cut face veneer containing no joints and/or seams. No matching required
